

Red Sealed Start Button

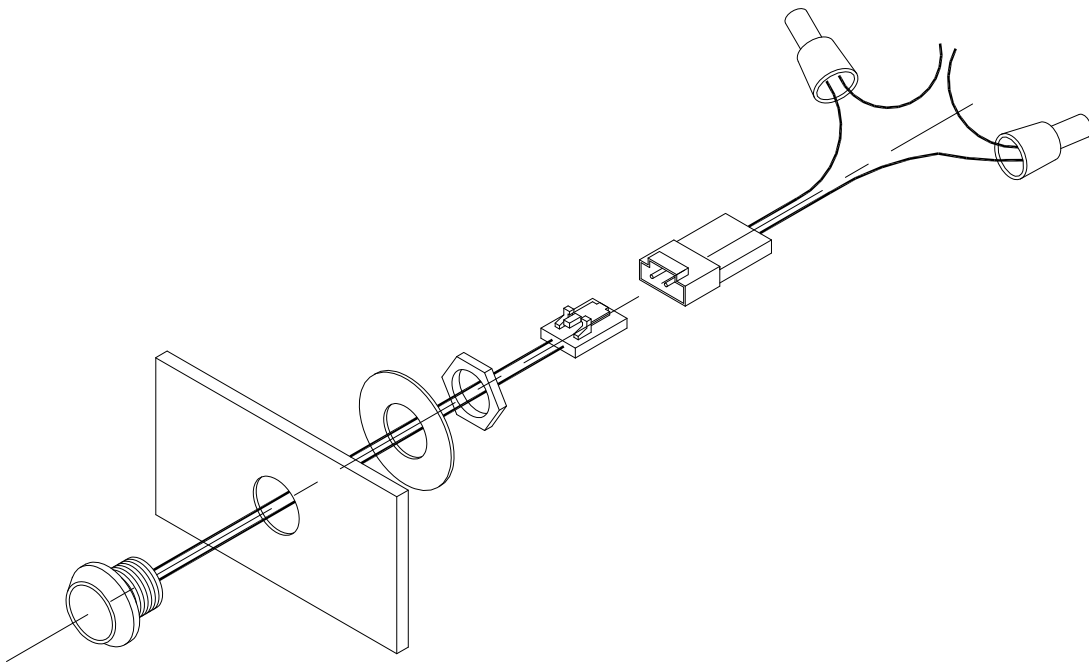

The red start button is used on various products but it can also be used as a replacement for older products. The button is sealed which helps protect it from moisture.

The start button leads terminate in a connector which is connected to a short pigtail. Once you have installed the kit if you need to replace a button in the future you simply disconnect the old button and connect a new one. The pigtail also comes with two pigtail connectors to connect to the start function wires.

The red sealed start button comes with a brass nut, a molded nut and three reducing washers so it can be adapted to most any surface, hole diameter and material thickness.
